Deploying a Zoho Creator Application from Development to Production Environment

Aim

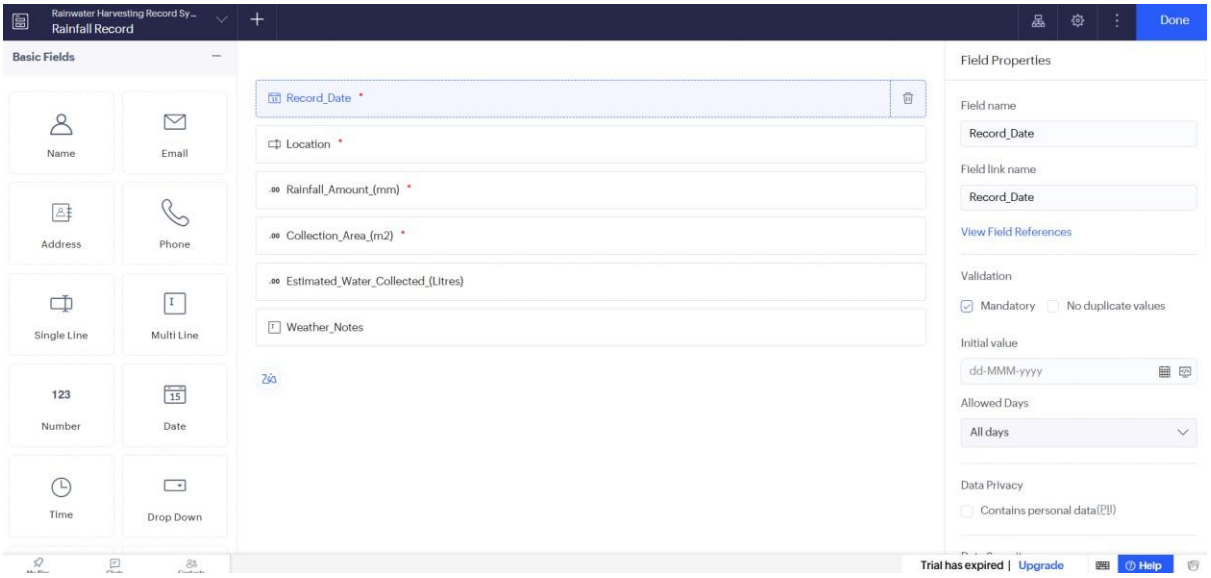

To deploy the Rainwater Harvesting Record System application from the development environment to the production environment in Zoho Creator and verify that the application functions correctly after deployment.

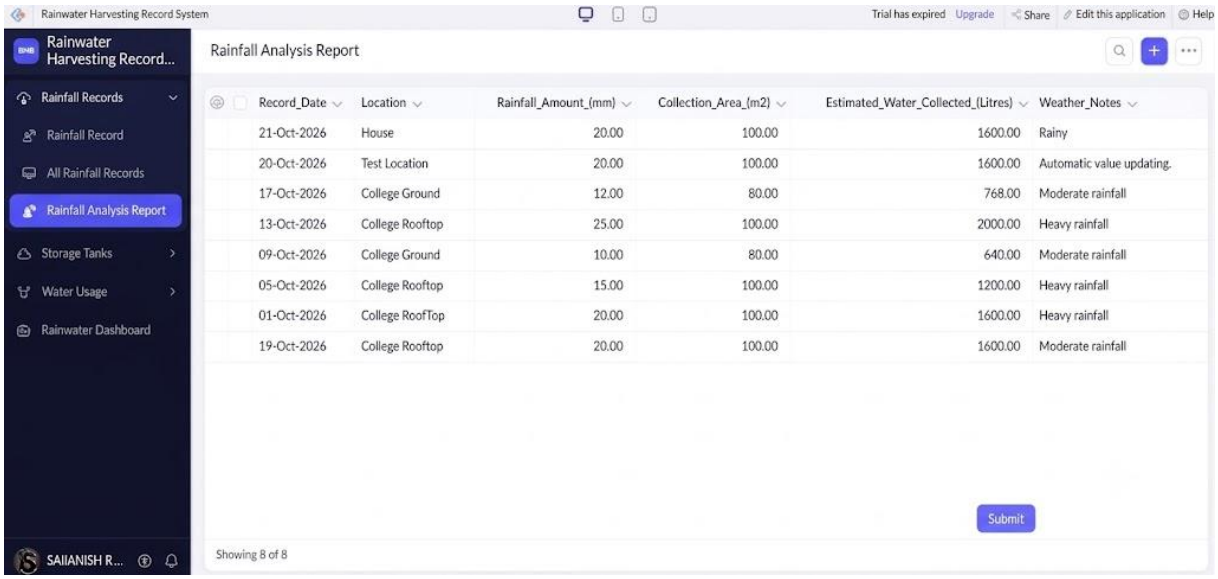

Procedure

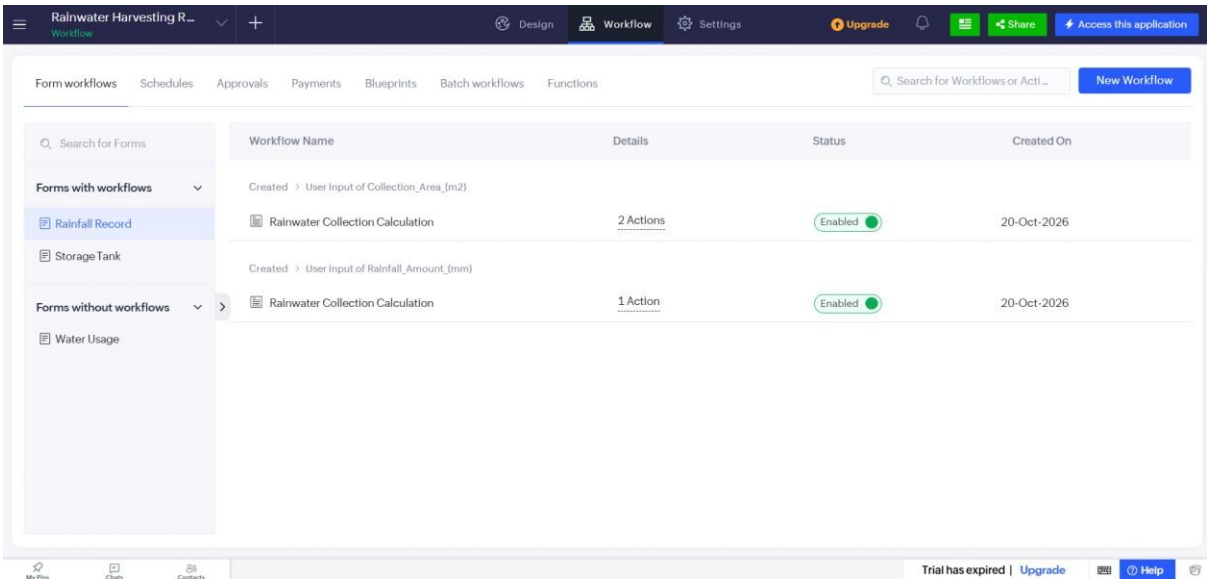

1. Log in to Zoho Creator and open the Rainwater Harvesting Record System application.
2. Complete the development of all required forms, reports, dashboards, workflows, and Deluge scripts.
3. Test the application in the development environment to ensure that all forms and workflows function correctly.
4. Verify the rainfall calculation, storage tank alert, and water usage lookup features.
5. Check the application for errors and confirm that the required fields and permissions are configured properly.
6. Open the application settings or deployment-related options available in Zoho Creator.
7. Select the appropriate deployment or publishing option to make the application available to the intended users.
8. Configure the required user permissions and access settings for the production environment.

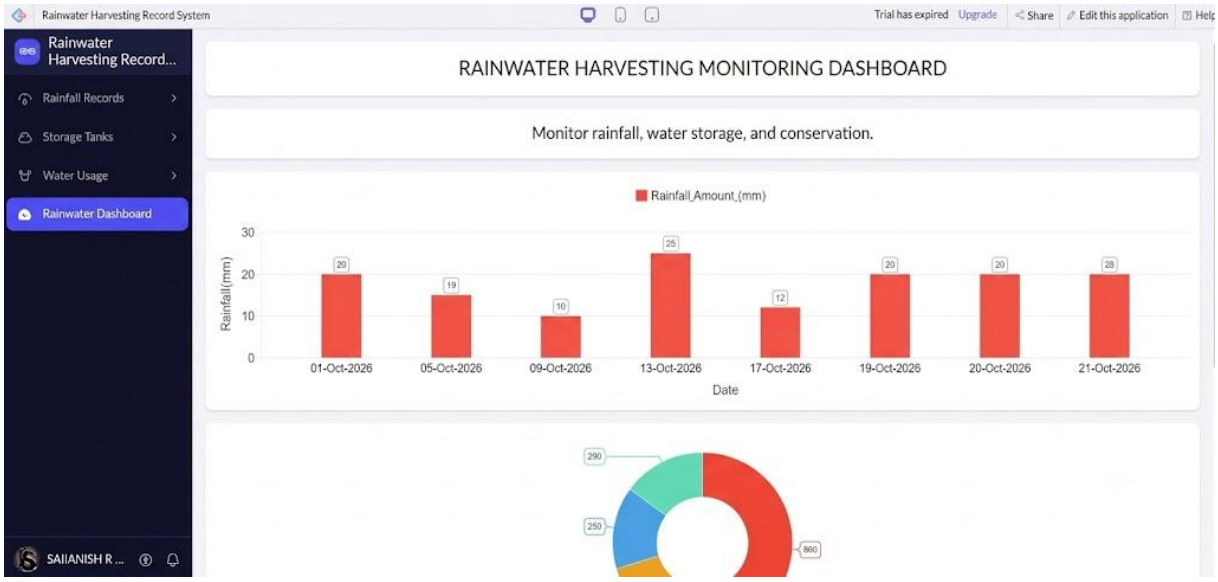

9. Publish or deploy the application by following the options available in the Zoho Creator interface.
10. Open the deployed application and test the forms, reports, dashboard, and workflows.
11. Verify that users can access the application according to their assigned permissions.

OUTPUT

Result

The procedure for deploying the Rainwater Harvesting Record System from development to production in Zoho Creator was studied. The application components, including forms, reports, dashboards, and workflows, were checked before

deployment. After publishing, the application can be tested to verify its functionality and accessibility for intended users.

Thus, the experiment demonstrates the process of preparing, publishing, and validating a Zoho Creator application for production use.
